PROFESSIONAL DEVELOPMENT

Since 01/2021	Guest Scientist , Department of Meteorology and Oceanography, Institute for Geology, University of Oslo, Oslo, Norway
01/2018-01/2021	Postdoctoral Research Scientist, Scientific Programmer Assistant , Department of Meteorology and Oceanography, Institute for Geology, University of Oslo, Oslo, Norway
07/2015-06/2017	Postdoctoral Research Scientist , Atmospheric Trace Gases and Remote Sensing, Institute of Meteorology and Climate Research, Karlsruhe Institute of Technology, Eggenstein-Leopoldshafen, Germany
2014	PhD , Institute of Nuclear Physics, Karlsruhe Institute of Technology, Eggenstein-Leopoldshafen, Germany
03/2010-12/2014	Doctoral Research Assistant , Institute of Nuclear Physics, Karlsruhe Institute of Technology, Eggenstein-Leopoldshafen, Germany

MAIN AREAS OF RESEARCH AND SHORT STATEMENT OF RESULTS ACHIEVED TO DATE

As a physicist by training, research is more than a simple profession, for me, it is a way to approach the complexity of our world. My curiosity about the complex and important role of ozone in the atmosphere lead me from studying its chemical depletion in the stratosphere and polar boundary layer to its formation and removal processes by land biosphere. Inter-disciplinary work has been a cornerstone for me to improve the understanding and push the develop of current numerical models of the Earth system forward. In particular have I been working on chemistry-climate modeling (CCM) using the EMAC (ECHAM/MESSy Atmospheric Chemistry) model. My work was related to future trends of stratospheric ozone, biogenic brominated very short-lived substances (VSLs), and the influence of sulfur aerosols. I have also implemented a bromine release mechanism from snow and studied ozone depletion in the Arctic boundary layer. As I identified dry deposition as a key issue for both future air quality as well as climate I committed my recent studies to effects of ozone on vegetation. I first focused on global and regional scale dry deposition and uptake by vegetation and later dived into process-based impact modeling at the leaf level and improvements of subarctic biomes. These research activities led to scientific and code contributions to the Community Earth System Model (CESM) and an involvement in the ICP Vegetation task force. Results were presented in scientific publications and on conferences both nationally and internationally. In addition, I gladly participated in public outreach, e.g. public lectures and popular science blogs.
